

Air curtains

Prevention of outside air transmission

Air curtain is a device that creates a flat, most aerodynamic stream of air at high air velocity and particularly with high dynamic-throw. Usually it is equipped with air heater and, often, with a filter to contain coarse impurities.

The purpose of air curtains is to prevent the air flow through the entry / door opening, or at least significantly reduce the velocity and transmission of cold outside air into the protected inner space. Air curtain prevents entry of insects and reduces the amount of dust generated in the shelter.
